

Industrial Attachment Time Plan

Overview

Department	Supervisor	Duration	Dates
Scripting & Automation	Makena	2 Weeks	25th May - 5th June
Design	Opemba	2 Weeks	8th June - 19th June
QA	Opemba	2 Weeks	22nd June - 3rd July
Data Analysis	Deepanshu	2 Weeks	6th July - 17th July
Development	Josh	3 Weeks	20th July - 7th August
Networking	TBC	3 days	10th August - 12th August
Client Relations	Ivine	2 days	13th August - 14th August

Training Objectives for a Castify Intern

The main objective of this internship training is to equip the intern with practical technical, analytical, operational, and customer-support skills needed to contribute effectively to Castify's products, systems, and daily business operations.

Training Area	Objectives of the Training	Skills Expected After Training
Scripting & Automation	To introduce the intern to automating repetitive tasks and improving operational efficiency using scripts and simple automation tools.	Ability to write basic scripts, automate routine workflows, use command-line tools, handle files and data programmatically, and troubleshoot simple automation errors.
Design	To help the intern understand user-centered design principles and how design supports product usability, branding, and customer experience.	Ability to create basic wireframes, understand UI/UX principles, use design tools, follow brand guidelines, and provide feedback on product interfaces.
Data Analysis	To train the intern to collect, clean, interpret, and present data for decision-making.	Ability to work with spreadsheets or analysis tools, clean datasets, create basic reports, identify trends, visualize data, and communicate insights clearly.
QA — Quality Assurance	To help the intern understand how software, products, or workflows are tested to ensure quality and reliability.	Ability to create and execute test cases, identify bugs, document issues clearly, perform basic regression testing, and understand the importance of quality standards.

Development	To expose the intern to software development processes, coding practices, version control, and product-building workflows.	Ability to understand basic software architecture, write or modify simple code, use Git or version control tools, collaborate with developers, and follow development best practices.
Networking	To introduce the intern to basic computer networking concepts that support system connectivity, troubleshooting, and infrastructure awareness.	Ability to understand IP addresses, DNS, APIs, servers, internet protocols, basic troubleshooting, and how different systems communicate.
Customer Operations	To help the intern understand customer support processes, communication standards, issue resolution, and service delivery.	Ability to respond professionally to customer issues, document support cases, escalate problems correctly, use customer support tools, and understand customer satisfaction metrics.

General Objectives of the Internship Training

By the end of the training, the intern should be able to:

1. Understand Castify's technical and operational environment.
2. Apply basic scripting and automation to improve productivity.
3. Support product design and user experience improvement activities.
4. Analyze data and prepare simple reports for decision-making.
5. Participate in quality assurance testing and bug reporting.
6. Contribute to basic development tasks under supervision.
7. Understand fundamental networking concepts used in digital systems.
8. Support customer operations through professional communication and problem-solving.
9. Work collaboratively with technical, design, QA, and customer-facing teams.
10. Demonstrate professionalism, adaptability, and continuous learning.

Skills Expected After the Training

After completing the training, the intern is expected to have developed the following skills:

Technical Skills

- Basic scripting and automation
- Software testing and bug reporting
- Basic programming and development workflow
- Use of version control tools such as Git
- Understanding of APIs, servers, and networking basics
- Data cleaning, analysis, and visualization

Design and Product Skills

- Basic UI/UX design understanding
- Wireframing and prototyping awareness
- Ability to review product usability
- Understanding of brand and design consistency

Analytical Skills

- Ability to interpret data
- Report preparation
- Problem identification
- Trend analysis
- Evidence-based decision-making

Quality Assurance Skills

- Test case creation
- Manual testing
- Bug documentation
- Regression testing awareness
- Attention to detail

Customer Operations Skills

- Professional customer communication
- Ticket handling and issue tracking
- Problem-solving
- Escalation procedures
- Customer experience awareness

Workplace and Professional Skills

- Team collaboration
- Clear documentation

- Time management
- Adaptability
- Critical thinking
- Accountability and professionalism

Expected Outcome

At the end of the internship, the intern should be capable of supporting Castify's technical, operational, and customer-related functions. They should be able to assist with automation, design reviews, data reporting, QA testing, development tasks, networking troubleshooting, and customer operations while working effectively within a professional team environment.

Scripting and Automation

The trainee will develop an automation script that will read a CSV containing video URLs, titles, and descriptions. It will validate that each video URL can stream successfully, then add the valid video title and description metadata to Airtable. Video thumbnails will be generated separately using an AI model based on the video titles and descriptions, then added to Airtable. After the videos are uploaded to Bunny, the returned Bunny URLs will also be updated in Airtable. Once Airtable contains the final metadata, the script will send that complete metadata to the CMS.

Daily timeplan:

Week	Day	Main Task	What Should Be Done
Week 1	Monday	Project setup	Create the project structure, initialize repository, set up environment variables, install dependencies, and define configuration files.
Week 1	Tuesday	CSV reader	Build the CSV reader, validate required columns, handle missing or invalid rows, and prepare parsed task data for processing.
Week 1	Wednesday	Logger and reports	Add logging, error tracking, progress reporting, and basic summary reports for completed, failed, and skipped records.
Week 1	Thursday	Metadata preparation	Prepare metadata fields from CSV data, normalize titles/descriptions/tags, and validate required CMS/Airtable/Bunny fields.
Week 1	Friday	Video validation	Validate video file paths or URLs, check file formats, confirm required metadata exists, and flag invalid videos before upload.

Week 2	Monday	Airtable client and Bunny client	Build Airtable integration for reading/updating records and Bunny integration for video upload, storage, and status checks.
Week 2	Tuesday	Checkpoint and resume support	Add checkpoint files or database state tracking so failed or interrupted batches can resume without duplicating work.
Week 2	Wednesday	Thumbnail readiness check and CMS client	Check thumbnail availability before publishing and build CMS client methods for creating/updating video content records.
Week 2	Thursday	Batch processing and retry handling	Implement batch execution, rate limiting, retry logic, failure handling, and clear status updates for each processed item.
Week 2	Friday	End-to-end orchestration, testing, and README documentation	Connect all modules into one workflow, run full tests, fix issues, document setup/usage, and add troubleshooting notes.
